

As per the requirements,
I have developed an Task Tracker.

In this I have used 3 components namely,

1)Header

2)Sign-In

3)Sign-Up

When we start the local server by default sign-in page will open.In that I have made validation for the input form.

If the user register he has to sign-in using the credentials(email-id and password),if the user gives the wrong credentials it'll show the pop-up message as wrong credentials on the top of the sign-in card.

If the user has not registered he has to sign-up using sign-up button

In sign-up page I have made validation for all the input page.

Once the user registers ,it'll show a pop-up message as "Registered successfully".

After that it will take the sign-in page,and user has to login using his credentials.

Once the user sign-in,it'll shows the all the details of the user with the message "You are signed in successfully".

Through the angular app i can run this at any time.
